

IVA-AE2 Clinical Report - Extended Test

Name: Case, Sample

Age: 21 Sex: F Report Date: 9/9/2015 Test Date: 8/16/2015 09:22 AM On Meds: N

The use of this Clinical Report requires that tests be administered in accordance with the specified test guidelines under the supervision of a licensed health care professional who is qualified in the use and interpretation of psychological tests. The test by itself is not to be used as a stand-alone instrument in making any diagnosis. Its primary purpose is to provide examiners with one or more diagnoses to consider as part of their comprehensive evaluation of clients who present with ADHD-type symptoms. This clinical report will be generated only after the clinician answers all of the relevant questions and then determines, using their professional judgment, the client's clinical diagnosis. This report is to be distributed to others only after it has been carefully reviewed, modified as needed, and signed by the examiner.

She is a 21 year old female who presents with the primary symptoms of conflicts on the job, difficulty staying organized and disorganized thinking. Symptoms were noted as occurring in the workplace and home settings. I have determined that these symptoms clearly impair her functioning. In addition, this individual has been identified as having anxiety and difficulty sleeping. Significant inattentive symptoms were observed during the clinical intake, but no significant ADHD-type symptoms were observed during the IVA-AE2 test administration. This individual's ADHD symptoms are not due to an inability to understand instructions. They are also not due solely to hostile or oppositional behavior.

This individual has not previously been diagnosed as having ADHD. Her symptoms have persisted for a sufficient period of time to support a diagnosis of ADHD. ADHD symptoms were identified to be present when this individual was a child. There is no family history of ADHD symptoms. This individual was not taking any medication at the time of testing that was likely to affect her test results.

The test results were fully valid, and this individual demonstrated sufficient motivation in completing this test. Her IVA-AE2 test scores suggested that the examiner consider the possible diagnosis of ADHD Inattentive presentation, Mild Neurocognitive Disorder, and other Mental Diagnosis. The rating scales results identified symptoms that supported the examiner's consideration of the diagnosis of ADHD, Inattentive presentation.

Based on my clinical judgment and overall evaluation, this individual's diagnosis is ADHD, Inattentive presentation, Severe. In order to help her at this time, I am making the following treatment recommendation of cognitive training. I am recommending that the following reasonable accommodations be made to help this individual in the workplace: allow the individual to work in a quiet room and provide work assignments in writing.

I have reviewed this interpretive report and have modified it as necessary in accordance with my comprehensive evaluation, the client's history and other relevant clinical data.
